

Turn a short PDF into a private reading site

This small document exercises the parts of a book import that are easy to inspect: prose, a command block, a comparison table, and a simple figure.

Source	Output	Access
A local PDF that stays outside Git.	MDX pages and PNG assets that can be reviewed.	A production reader protected by one passkey.

What this sample proves

- The importer can preserve ordinary prose and heading order.
- Structured material remains readable after conversion.
- A reviewer can compare the PDF, MDX, and rendered site.

Written for the Book Studio template. The source and generated sample are released under the repository's MIT License.

1. Prepare a repeatable import

A useful import starts with a stable source and a stable book slug. Keep the original PDF in the local books directory, then let the agent create reviewable MDX and image assets. The source PDF does not need to enter Git.

Install the pinned tools

```
mise install
pnpm install --frozen-lockfile
uv run .agents/skills/import-book/scripts/run_docling.py examples/sample-book.pdf
--book-slug sample-book
```

The command produces a Docling bundle for the agent to inspect. It is evidence, not the final book. The agent still compares each section with rendered PDF pages before publishing MDX.

Know what belongs in Git

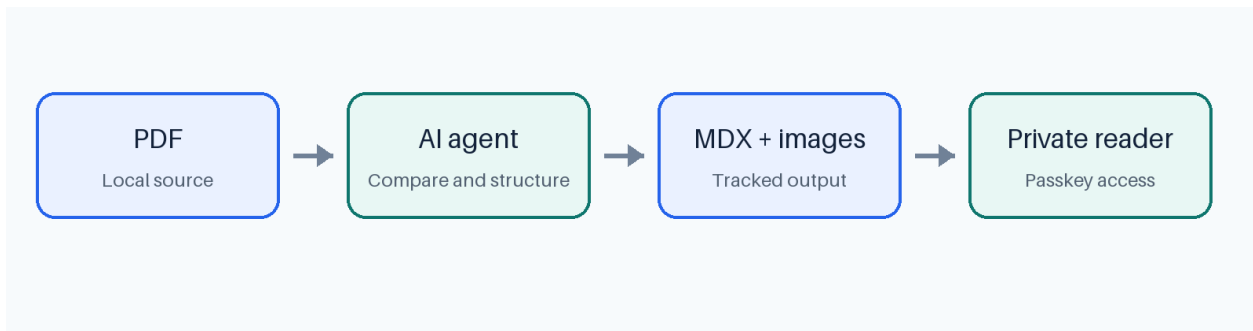

Artifact	Purpose	Tracked in Git
Original PDF	Local source for the agent	No
MDX	Book pages rendered by the site	Yes
PNG assets	Figures used by the book pages	Yes
Docling output	Temporary conversion evidence	No

Repository visibility is separate from web access

The passkey protects production routes. If generated MDX and images contain sensitive material, keep the Git repository private as well.

2. Verify before you publish

A finished import should be easy to audit. Check the source page count, render the pages that contain tables or figures, and compare them with the corresponding MDX. Run the repository checks only after the content comparison passes.

One local source becomes reviewable content and a protected reader.

Final review

- Every published section has a matching source range.
- Figures use stable paths under content-assets/books.
- `pnpm lint`, `pnpm test`, `pnpm types:check`, and `pnpm build` pass.
- `SITE_URL` matches the production origin before passkey setup.

Result

The sample is complete when the PDF has three pages, the figure is legible, the MDX builds, and private routes require the owner's passkey in production.
